

Americans Are Using More Energy

Tuesday, 26 May 2015

I'm pretty sure most of us are on some type of energy devices at some point of the day, and such devices would utilize electricity in order to operate. Well, according to the latest report released by the researchers at the Lawrence Livermore National Laboratory, they have recently determined that Americans are using more energy than ever, when compared to previous years.

Although increased energy consumption would also mean more burning of fossil fuel in order to meet electricity demands, it seems the diversification of energy sources to green energy has somewhat soften the carbon emissions. Statistics showed that green energy generation has rapidly increased over the years, whereby solar energy generation grew by 33 percent, while wind energy generation has increased by a good 8 percent.
